Introduction

More than 7,000 U.S. businesses, singly and in joint ventures, have proposed over 4,500 projects to the Advanced Technology Program (ATP) since 1990, requesting nearly $10 billion in research funding. Approximately 12 percent of the proposals have been selected by the ATP for funding, for a total of 522 funded projects with 1,162 participants and approximately an equal number of subcontractors, through 2000. A growing number of the multiyear projects funded are now completed or nearing completion. This study focuses on the first 50 completed projects, and, to a lesser extent, on 16 projects terminated prior to completion during the same period.

ATP: A Partnership with Industry

The ATP attracts challenging, visionary projects with the potential to develop the technological foundations of new and improved products, processes, and even industries. The ATP partners with industry on this research, fostering collaborative efforts and sharing costs to bring down high technical risks and accelerate technology development and application. These are projects that industry in many cases will not undertake without ATP support, or will not develop in a timely manner when timing is critical in the highly competitive global market. The program funds only research, not product development. The ATP is managed by the National Institute of Standards and Technology, an agency of the Commerce Department’s Technology Administration.

ATP awards are made on the basis of a rigorous competitive review which considers the scientific and technical merit of each proposal and its potential benefits to the U.S. economy. The ATP issues a proposal preparation kit that presents and explains the selection criteria to prospective applicants and provides guidance on preparing proposals. U.S. businesses conceive, plan, propose, and lead the projects. Government scientists and engineers who are expert in the relevant technology fields review all proposals for their technical merit. Business, industry, and economic experts review the proposals to judge their potential to deliver broadly based economic benefits to the nation — including large benefits extending beyond the innovator (the award recipient).

The ATP delivers benefits to the nation along two pathways: 1) a direct path by which the U.S. award recipient or innovator directly pursues commercialization of the newly developed technologies; and 2) an indirect path which relies on knowledge transfer from the innovator to others who in turn may use the knowledge for economic benefit. Either path may yield spillover benefits. The ATP looks to the direct path as a way to accelerate application of the technology by U.S. businesses. It looks to the indirect path as a means of achieving additional benefits, or benefits even if the award recipient fails to continue. The ATP’s two-path approach to realizing national benefits offers advantages: one path may provide an avenue for benefits when the other does not, and both paths together may yield larger, accelerated benefits as compared to having a single route to impact.

Project Evaluation

The ATP, like other federal programs, is required by law to report on its performance. The ATP established its evaluation program soon after it began, even before evaluation was widely required by Congress. The Economic Assessment Office (EAO) of ATP plans and coordinates

INTRODUCTION

The Advanced Technology Program (ATP) was established by the U.S. Congress in 1980 as a public-private partnership to accelerate the development and commercialization of new products and processes that will enhance the nation’s economic competitiveness and national security. The ATP was designed to leverage federal investments by matching them with private sector funds and to encourage collaboration among businesses, universities, and research institutions. Over the past decade, the ATP has funded over 500 projects in a wide range of technologies and industries, including biotechnology, information technology, and renewable energy.

Now, as the program completes its first decade of operation, there are a growing number of projects that have completed their ATP-funded research and moved into the post-project period. This group of 50 projects makes it possible to look at the projects several years after the ATP-funded research has been completed—allowing sufficient time for knowledge to be disseminated and progress to be made toward commercial goals. The larger group of projects makes it possible to form a portfolio view, compile aggregate statistics, and analyze the results in terms of their implications for overall program success.

A first step was taken toward this goal with the publication of a report in 1999 on the first 38-completed projects. This report takes the next step, by extending coverage to a total of 50 projects and adding consolidated performance metrics. It draws from and builds on the previous report.

At the core of this study are 50 mini-case studies covering each of the completed projects. Each of these briefly tells the project story, recounting its goals and challenges, describing the innovators and their respective roles, and assessing progress to date and the future outlook. Photographs illustrate many of the projects.

Although the particulars vary for each project, certain types of data are systematically collected for all of them. Consistent with ATP’s mission, the evaluation focuses on collecting data related to the following dimensions of performance:

- **Knowledge creation and dissemination**, which is assessed using the following criteria: recognition by other organizations of a project’s technical accomplishments; numbers of patents filed and granted; citations of patents by others; publications and presentations; collaborative relationships; and knowledge embodied in and disseminated through new products and processes.

- **Commercialization progress**, which is gauged in terms of the attraction of additional capital for continued pursuit of project goals, including resources provided by collaborative partners; entry into the market with products and services; employment changes at the

2 The Government Performance and Results Act (GPRA) is a legislative framework for requiring federal agencies to set strategic goals, measure performance, and report on the degree to which goals are met. An overview of the GPRA is provided in Appendix 1 of the General Accounting Office Executive Guide, Effectively Implementing the Government Performance and Results Act, GAO, Washington, D.C., GGD-96-118, 1996.

3 For a description of the ATP evaluation plan, see Ruegg, “Assessment of the ATP,” The Advanced Technology Program, Challenges and Opportunities, Board on Science, Technology, and Economic Policy, National Research Council, Washington, D.C., National Academy Press, 1999, pp. 71-81. Published economic studies of the ATP are available at the ATP website (see above), and can be requested by calling (301) 975-4332.

small companies leading projects and other indicators
of their growth; awards bestowed by other organiza-
tions for business accomplishments of project leaders;
and the analyst’s assessment of future outlook for the
technology based on all the other information.

The approach is to provide in an overview chapter the
aggregate statistics of interest across the set of 50 projects,
such as the total number of patents and the percentage of
projects whose technologies have been commercialized.
In addition, the aggregate statistics are combined to pro-
duce composite project metrics for overall performance.
The composite performance scores allow one to see at a
glance the robustness of a project’s progress towards its
goals. Underlying the simple scores is a wealth of data.

Sources of Information
Data for the 50 projects were collected from many sources:
A TP project records; telephone interviews with company
representatives; interviews with ATP project managers;
company websites; the U.S. Patent and Trademark Office;
in-depth project studies conducted by other analysts; aca-
demic, trade and business literature; news reports; filings
at the Securities and Exchange Commission; a previous
study of the first 38 completed projects; and business
research services, such as Dun and Bradstreet, Hoover’s
Online, Industry Network, and CorpTech. Each one of
the individual project write-ups was reviewed for accuracy
by the project’s lead company and ATP staff.

Study Limitations and Future Directions
The 50 projects are divided into two groups: 1) the data
for the first 38 projects were collected mainly between
1997 and late 1998, and 2) the data for the next 12 projects
were collected during 1999 and early 2000. Since devel-
lopments continue to unfold for most of these projects,
the output measures for the earlier set of 38 may have
changed significantly since the data were collected.
Even outputs for the later set of 12 projects may have
changed since the data were collected.

The cases provide a snapshot of progress several years
after the completion of the ATP-funded projects. The
cases, although undertaken at different calendar dates, are
conducted within about the same interval of time after
ATP funding ended. Yet, different points in each technol-
ogy’s life cycle may be captured, depending on the technol-
yogy area. Information technology projects, for example,
may be expected to be further along than advanced mate-
rials and chemical projects. Examined at a later time, there
may be less (or more) difference in the accomplishments
among projects in different technology areas.

This study tracks outputs leading to knowledge
dissemination but it does not assess the actual commercial-
ization efforts by others who acquire the knowledge. The
tracking of commercialization efforts is limited to the
direct path of impact (i.e., commercialization by the
award recipients or innovators).

Future studies may add mini-cases for additional com-
pleted projects to this group of 50, which would also be
conducted several years after project completion. Such
an extension would provide a more comprehensive view
of progress made by projects at a comparable interval in
time after the ATP-funded research has been completed.
Additional future studies may also update these studies
by looking at the projects farther out in time. An extension
of the study further into the post-project period would
allow for a fuller assessment of the value in the use of
products and processes commercialized by the award
recipients, and of the benefits resulting from the use of
the knowledge (developed during the project) by others.

“Completed” and “Terminated” Projects Defined
Projects do not necessarily finish in the order funded.
For one thing, they have different lengths, ranging from
approximately two years to no more than five years. For
another, they are required to file a final report with the
ATP and have financial and other paperwork completed
before project closeout. The financial closeout is done
through the National Institute for Standards and
Technology (NIST) Grants Office, which notifies the
ATP that it considers the project completed. This study
assesses the first 50 projects the Grants Office declared
“completed.”

During the time the first 50 were in progress, another
16 projects were stopped short of completion. Some of
these were announced as award winners but never officially
started. Other projects got off the ground but were closed
for various reasons with a substantial amount of the techni-
cal work still unfinished. These “terminated” projects are

---

1 William Long collected the data for the first 38. Jonathan Tucker, Chris Hansen, Josh Rosenberg, Jon Dryfus, Benjamin Fletcher, Kathleen McTigue,
Michael Walsh, Mariah Tanner, and Karen Seeh collected the data for the next 12, supplemented by data collected by Rosalie Ruegg.

2 In several cases, more recent information is brought into the report to determine if the designated “top performing projects” have continued to make
progress.

3 Ibid.
assessed according to the principal reasons they stopped before completion. They are treated in Appendix B.

While the terminated projects are generally regarded as unsuccessful, some produced potentially useful outputs. Appendix B illustrates a project that made an attempt to achieve its goals, only to be terminated prior to completion. It is reported in a level of detail and style similar to that provided for the 50 completed projects.

**Report Organization**

Chapter 1 provides a summary overview of the performance of the 50 completed projects as a group. It identifies some major outputs that appear useful as indicators of the degree of project success, and it uses these outputs in a prototype project performance rating system. A preview also notes some of the broad-based benefits that this portfolio of projects is producing and likely to produce. For additional background, the make-up of the portfolio of projects in terms of technologies, organizational structure, company size, and other features is provided.

The individual project reports presented in Chapters 2 through 6 highlight major accomplishments and the outlook for continued progress. A detailed account of the project under review is given, with attention to technical and commercial goals and achievements, information about technology diffusion, and views about the role played by ATP funding. A performance rating is assigned to each project based on a four-star scoring system. The rating depends on the accomplishments of the project in creating and disseminating new scientific and technical knowledge and in making progress toward generating commercial benefits, as well as the outlook for continued progress.

Two appendices provide supporting information. Appendix A provides a listing of technical and commercial achievements of each completed project. Appendix B provides a discussion and assessment of 16 terminated projects, together with a detailed case that illustrates how a terminated project may yield outputs of potential benefit.
